STUDENTS PERFORMANC ANALYTICS DASHBOARD

Power BI – Week 8 Project Report

A visual report documenting the current dashboard layout, KPI cards, and

subject-performance charts created in Power BI

BY- Sowmiya R

1. Project Overview

The purpose of this Week 8 project is to build an interactive Student Performance Analytics Dashboard in Power BI. The dashboard summarizes students' academic results through key performance indicators (KPIs) and subject-level visuals. It is intended to help users compare Mathematics, Reading, and Writing scores and explore overall performance.

2. Explanation of the First Screenshot

The first screenshot shows the current Student Performance dashboard canvas. The top row contains five KPI cards. These cards give a quick summary of the main measures without requiring the viewer to inspect individual student records

Screenshot 1 – Dashboard overview

Shows all five KPI cards and three subject/overall-performance visuals on the report canvas. This is the main overview page. The top cards are readable, while the large lower-left chart needs a category axis or a clustered chart setup for easier comparison.

Screenshot 2 – Average Score card selected

The Average Score KPI card is selected. The Build visual pane shows the field used for the card. This confirms that the card is connected to the Average Score measure and can be positioned and formatted independently.

Screenshot 3 – Average Math Score card selected

The Average Math Score card is selected. The displayed value is 66.09. This KPI helps compare Mathematics performance with Reading and Writing

Screenshot 4 – Overall Pass % card selected

The Overall Pass % card is selected and currently displays 0.98. Before final submission, verify the measure and set its format to Percentage if the value represents a proportion.

Screenshot 5 – Average Reading Score card selected

The Average Reading Score card is selected and displays 69.17. This is the highest of the three displayed subject averages in the current dashboard

Screenshot 6 – Average Writing Score card selected

The Average Writing Score card is selected and displays 68.05. The card provides a quick view of writing performance and supports comparison with the other subject KPIs.

Screenshot 7 – Main subject chart selected

The large subject chart is selected and its field wells are visible. The X-axis is empty while the Y-axis contains score measures. Add a meaningful category/axis or switch to a clustered column chart arrangement so the three subject averages are shown side by side, not as one stacked total.

Screenshot 8 – Smaller comparison charts selected

The screenshot shows the compact subject comparison and Average Score versus Overall Pass % visuals. Increase the visual size or simplify titles and legends. Keep Average Score and Pass % on separate scales or use a suitable combo chart to avoid misleading comparisons

Final Validation Checklist

- KPI values and DAX measures are correct.

Overall Pass % is formatted and interpreted correctly.

- Subject charts show the averages in a clear, comparable layout.
- Slicers filter the intended visuals.
- Drill-through to Academic Profile and the Back button work.
- Titles, legends, labels, and visual alignment are clear.
- No blank or error visuals remain.
- Save the final .pbix file and submit screenshots/PDF as required

Conclusion

The current Power BI report establishes the foundation of the Week 8 Student Performance Analytics Dashboard through KPI cards and initial score-comparison visuals. Completing the recommended charts, slicers, drill-through page, and validation steps will make the dashboard more interactive and useful for academic performance analysis
